Cancer data services via Research Infrastructures

canSERV

canSERV is an EU-funded project under the Horizon Europe programme that provides cutting edge, interdisciplinary and customised oncology services across the entire cancer continuum. The aim is to offer a comprehensive portfolio of oncology-related research services available to all scientists in EU member countries, associated countries and beyond.

canSERV overview

Consortium

canSERV's mission is to make cutting-edge and customised research services available to the cancer research community EU wide, enable innovative R&D projects and foster precision medicine for patients' benefit across Europe.

The project envisions establishing an open and sustainable collaborative network of research infrastructures (RIs) in oncology that will offer world-class services to researchers, universities, institutes, high-profile SMEs, and European research consortia.

This will foster a defragmentation of a Europe-wide, integrated, network of RIs to strengthen Europe's Research & Innovation (R&I) portfolio for tackling cancer and accelerate the developmental pipeline of oncology innovation in Europe.

- **Disease Models**
- **Advanced technologies for personalised oncology**
- **New therapeutic solutions**
- **Biomarker research, development and validation**
- **Open digital research services**
- **Accelerated translation into personalised oncology clinical practice**
- **Clinical trials and design**
- **Access to human samples and data**
- **Training**
- **Ethical, legal and socio-economic (ELSI) dimensions**

Browse canSERV's services to see if they can help you with your research.

The canSERV open call is open to applications until the 15th of July.

Catalogue

canSERV offers over 400 services for transnational access via its catalogue, split into ten different themes

Transnational access can be:

- **In person** (physical access), with users visiting the research infrastructure facility/installation and receiving the service "hands-on", including the advantage of direct collaboration.
- **Remotely** (remote access), with research infrastructure resources and services offered online/remotely. This can span from just sending requested sample materials, to more comprehensive research tasks done by the research infrastructure staff on your behalf.

ELIXIR's role

ELIXIR put together a list of Hub and Node based services forming a large proportion of the 'Open Digital Services' theme. ELIXIR also takes a lead role in ensuring results and/or data obtained from using the services provided via canSERV comply with the FAIR principles.
