Content Analysis of Institutional Policies on Open Science: Brazil, France, Peru, UK

Alejandra Manco

STI 2022 Granada
Sep 7-9

Introduction

Open science is gaining traction worldwide, with open science policies being enacted at institutional, national, regional, and international levels. During the last ten years, **many institutions have begun to design, adopt, and implement open science policies** (Schmidt et al., 2018) (Kretser et al., 2019).

Method

Qualitative document analysis (Bowen, 2009) (Cardno, 2018).
1. Top 20 universities of QS World University Ranking 2022 in each of the 4 countries.
2. For each university, we searched to find an open science policy. Search 1: **search google using [University name] AND open science policy**. Search 2: **Go to the university's website and search [open science policy]**.
A total of 31 documents were retrieved after the search process. 16 from France, 14 from the UK, 1 from Brazil, 0 from Peru.
Inductive thematic categorization - Nvivo 12.

Results

OS definitions opening research outputs. Often intertwined with a transparency in science claim.

Different strategies changes in the evaluation elements for research assessment, enhancing internal communication and collaboration, Ph.D. students training in open science, offering support to researchers, and skills development and

training in software.

OS components emphasized are open access and open research data. Only very seldomly other components are also stated.

Institutional open science policies address the researcher's career as **responsible research assessment.**
However, this issue is primarily discussed in French documents.

Policy intertextuality Declarations: France - Jussieu Call for Open science and bibliodiversity.
UK & Brazil - San Francisco Declaration on Research Assessment (DORA). Brazil - UNESCO recommendations on open science & UN's 2030 Agenda for Sustainable Development.
National references: France: Law for the Digital Republic of 2016. CNRS roadmap for open science. National Plan for Open Science.

Relations to other issues No specific mention of **science policy**. Brazilian open science declaration - **equity, diversity, and inclusion** as inherent to open science, social impact of science, and development. The policies do not discuss further economic and political contexts.
Internal communication: researchers & academic community. However, the subject of the general public -society overall- is related to the idea of making science accessible to all and not specifically to public science communication.

Discussion and Conclusions

Open science is defined as **opening research outputs** in the different institutional policies.
Brazilian institution's declaration on open science relates to the **international organizations reference.**
France: interest in open science is a **strategic goal for the government through a top-down policy approach** (Méndez, 2021) to which the different institutional open science policies are aligned.
Absence of policies in the South American may indicate that even though the subject of open science is extensively discussed, it is still **not materialized in action.**
