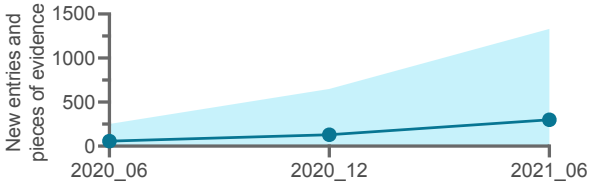
DisProt in 2021 - Expanding manually curated annotations of IDPs

Edoardo Salladini*, Federica Quaglia, András Hatos, Silvio C.E. Tosatto, Damiano Piovesan

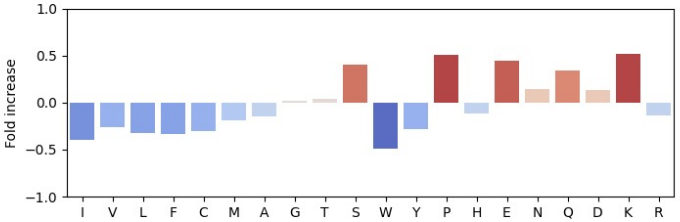
Background

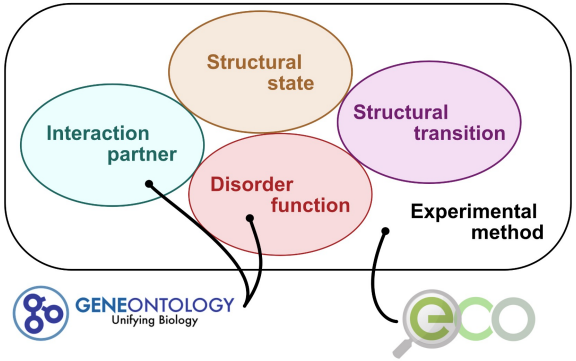
In 2020 DisProt, the manually curated database of intrinsically disordered proteins (IDPs), transitioned to a six-month based release schedule. The last releases feature newly added proteins as well as revised and updated published entries. Several aspects of IDPs are now extensively covered and explored by a small team of expert DisProt reviewers, in an effort to continuously improve curation accuracy and provide comprehensive and up-to-date annotations.

Increase in annotated entries and pieces of evidence



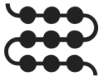
DisProt fold increase/decrease in amino acid distribution compared to TrEMBL distribution





Adoption of two stable ontologies - **GO** and **ECO** - to improve **interoperability** and data **standardization** of our manually curated annotations

Reviewed and updated entries of well-known IDPs considering new results being published, to ensure that we provide the most comprehensive annotations, e.g. HMGA1 (DP00040), HSP12 (DP00705), p27 (DP00018)



unicellular toxins and antitoxins

extracellular matrix proteins
