ELIXIR Compute Platform

ELIXIR All Hands 2023, 5 - 8 June, Dublin, Ireland

Compute Platform Leadership

Jonathan Tedds (Hub)

Gavin Farrell (Hub)

Ludek Matyska (CZ)

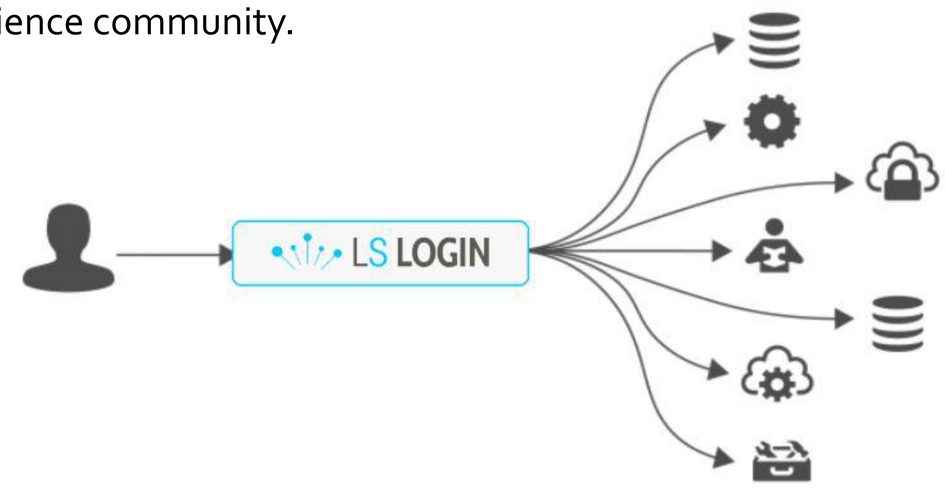
Juha Törnroos (FI)

Harald Wagener (DE)

The ELIXIR Compute Platform is led by Jonathan Tedds, Programme Manager for Scientific Computing, who oversees its strategic direction and operations and is supported by Gavin Farrell, the Technical Officer. The Platform further benefits from the expertise of the Platform Executive Committee members: Harald Wagener (DE), Ludek Matyska (CZ), and Juha Tornroos (FI)

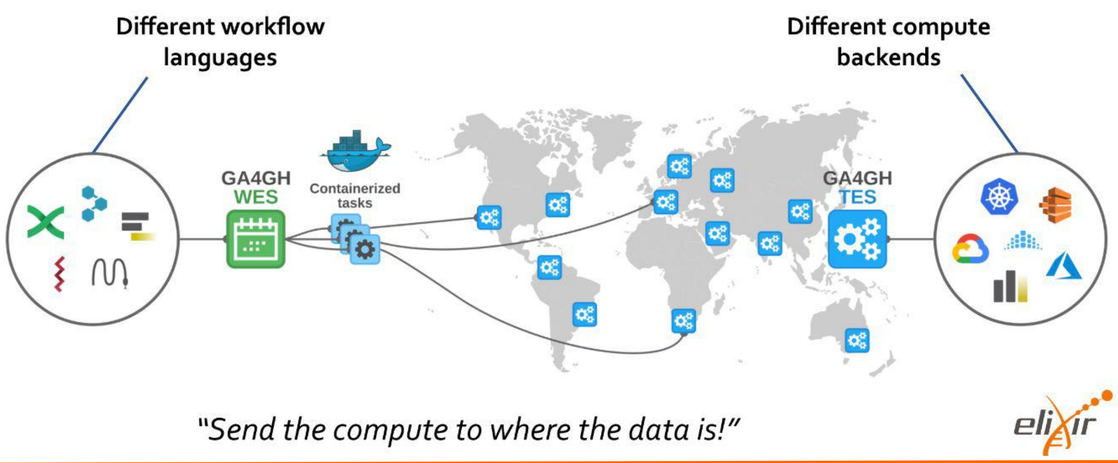
Life Science Login

Life science (LS) Login is co-developed and operated by ELIXIR-CZ and ELIXIR-FI Compute Platform members and implemented through the EOSC-Life project. It provides secure identity and access management for providers and users of life science services. In Norway, the federated European Genome-phenome Archive (EGA) utilizes life science login to grant authorized individuals access to its secure data repositories. This authentication and authorisation infrastructure (AAI) plays a crucial role in facilitating seamless and secure AAI for the wider life science community.



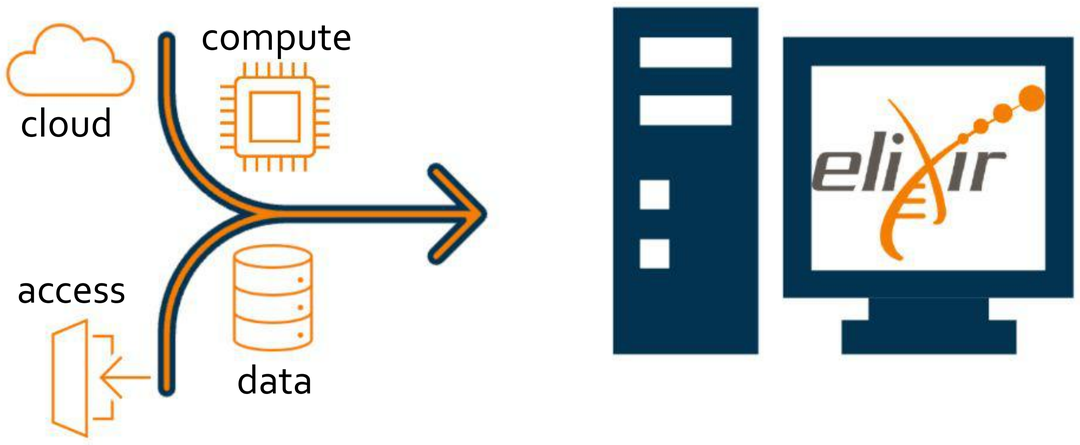
ELIXIR::GA4GH Cloud

The ELIXIR Compute Platform leads the ELIXIR::GA4GH Cloud & AAI Driver Project, which is a part of the Global Alliance for Genomics and Health (GA4GH). It focuses on developing, promoting, and adopting GA4GH cloud and researcher identity standards. In turn, the Compute Platform represents ELIXIR's interests and use cases within the GA4GH, fostering collaboration and alignment across the two organizations.



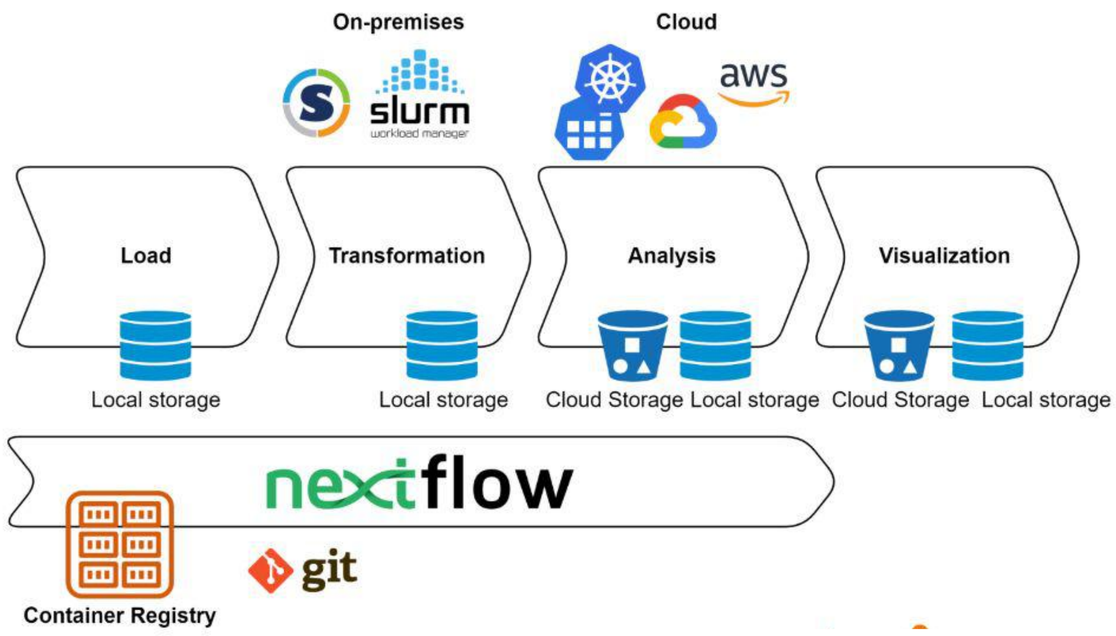
Compute Platform Mission

The ELIXIR Compute Platform was established to coordinate and integrate cloud, compute, storage and access services for the life-science research community.



Hybrid Cloud

The 2022-2023 Compute Platform Hybrid Cloud Task focused on integrating cloud and compute services across ELIXIR Nodes to enable implementation of distributed multi-cloud workflows. It involved defining the ELIXIR hybrid cloud ecosystem through use cases and conducting pilot projects to demonstrate usability. These efforts will be published in an upcoming paper highlighting real world implementations of hybrid cloud usage in ELIXIR and the life sciences.



EOSC & EuroHPC

ELIXIR Compute Platform actively promotes it's services in wider international initiatives including the European Open Science Cloud (EOSC), EuroHPC and GAIA-X. Building on the ELIXIR-EOSC Strategy, the ELIXIR Compute Platform benefits from the collaborative infrastructure and services provided at a European level. ELIXIR Nodes are leading members of EuroHPC for high performance computing, including CSC in Finland (hosting the LUMI supercomputer) and BSC in Barcelona (hosting Leonardo). This ensures life scientists will have access to class leading compute facilities and facilitate federated analytics at scale.
