The 10-year evolution of Bioschemas to immortality

Phil Reed[1], Nick Juty[1], Helena Schnitzer[2], Leyla Jael Castro[3], Alban Gaignard[4], Carole Goble[1]

Bioschemas.org defines domain-specific metadata schemas based on schema.org extensions, which expose key metadata properties from resource records. This provides a lightweight and easily adoptable means to incorporate key metadata on web records, and a mechanism to link to domain-specific ontology/vocabulary terms. As an established community effort focused on improving the FAIRness of resources in the Life Sciences, we now aim to extend the impact of Bioschemas beyond improvements to 'findability'.

2015

2018 first ELIXIR BioHackathon

2021 terms accepted in schema.org 13.0

2022 first profile 1.0 releases

2023 schemas.science starts

2025 10th birthday

bit.ly/joinbioschemas

Extend into non-'bio' domains

The road to immortality

Our sister site **schemas.science** is dedicated to hosting the many domain-agnostic types/profiles (including workflows, datasets, training materials): https://schemas.science/

- Easily use ontologies in records
- Sustainable
- Collaborate
- Long-term impact
- AI and ML ready
- Wide ranging
- Support existing community
