Visual Correspondence Hallucination

Hugo Germain[1] Vincent Lepetit[1] Guillaume Bourmaud[2]

ICLR

1. Low-overlap keypoint matching

- Keypoint matching is key for fundamental matrix & camera pose estimation
- In low-overlap scenarios however, finding correspondences is very challenging
- Existing methods will tend to find correspondences in non-covisible areas

SuperPoint + SuperGlue

- Correct matches within image boundaries provide poor constraints

2. Introducing NeurHal

- We predict correspondence maps on extended field-of-views
- Training is done on both covisible and non-covisible samples
- We resort to a Transformer-based image processing backbone

3. Application to absolute camera pose estimation

- We provide quantitative analysis of NeurHal's ability to hallucinate

NeurHal on validation image pair (novel scene)

- NeurHal achieves sota on absolute pose estimation for low-overlap image pairs
- More results in our paper !

Source Target Predicted NRE Map
